unknown.mrc in exported stacks

hi again,

am still struggling with getting an exported stack containing original micrograph names.  From what I understand (in first post below) this information may be lost forever during import?  I hope that adding in this meta data for future cisTEM iterations will be considered as the default when exporting stacks.

I followed this post, which gave me **particle number,** but I instead want micrograph name.

https://cistem.org/micrograph-name-after-cistem-refinement

I tried following this post under subsection "images in a group" but received null return when I input "select * from image_group_list;"

https://cistem.org/documentation#tab-1-16

thanks again for your hard work

timgrant

Hi,

Hi,

Yes I'm sorry the micrograph names are not kept when they are imported.  I think the only way to get what you want is to output the particle number from cisTEM, then track that back to your original star file to get the names.

Tim
