prepare_stack_matchtemplate

Hi

The program generates a particle stack (and a related star file) per micrograph.

I want to combine them together so I can run reconstruct3d with all the particles, but not sure how.

Any help would be much appreciated, thanks in advance.

PS:all steps via command line

jojoelfe

Hi,

Hi,

there are multiple ways you can try:

1) Use `add_two_stacks` to merge the stacks together and combine star files via pasting the lines (or use the excellent `starfile` python package)

2) You can also try to first combine the star files and then use `combine_stack_by_star`

Sorry there isn't a more straightforward way. Everybody has their own little strategy, because every project is a bit different
